The Maximum Likelihood Estimator (MLE)

Let X_1, \ldots, X_n be i.i.d in \mathcal{X} from a probability distribution P_0 .

Statistical inference :

- propose a model $(P_{\theta}, \theta \in \Theta)$, assume $P_0 = P_{\theta_0}$.
- compute $\hat{\theta}_n = \hat{\theta}_n(X_1, \dots, X_n)$.

Letting p_{θ} denote the density of P_{θ} , then

$$\hat{\theta}_n^{MLE} = rgmax_{ heta \in \Theta} L_n(heta), ext{ where } L_n(heta) = \prod_{i=1}^n p_{ heta}(X_i).$$

Example : $P_{(m,\sigma)} = \mathcal{N}(m,\sigma^2)$ then

$$\hat{m} = \frac{1}{n} \sum_{i=1}^{n} X_i \text{ and } \hat{\sigma}^2 = \frac{1}{n} \sum_{i=1}^{n} (X_i - \hat{m})^2.$$

Some problems with the likelihood Minimum Distance Estimation (MDE)

MLE not unique / not consistent

Example :

$$p_{ heta}(x) = rac{\exp(-|x- heta|)}{2\sqrt{\pi|x- heta|}},$$

Some problems with the likelihood Minimum Distance Estimation (MDE)

theta

2 -

0.1

MLE not unique / not consistent

Example :

$$p_{\theta}(x) = \frac{\exp(-|x-\theta|)}{2\sqrt{\pi|x-\theta|}},$$

$$L_n(\theta) = \frac{\exp(-\sum_{i=1}^n |X_i-\theta|)}{(2\sqrt{\pi})^n \prod_{i=1}^n \sqrt{|X_i-\theta|}}.$$

MLE fails in the presence of outliers

What is an outlier?

Huber proposed the contamination model : with probability ε , X_i is not drawn from P_{θ_0} but from Q that can be anything :

$$P_0 = (1 - \varepsilon) P_{\theta_0} + \varepsilon Q.$$

Example : $P_{\theta} = Unif[0, \theta]$, then

$$L_n(\theta) = \frac{1}{\theta^n} \prod_{i=1}^n \mathbb{1}_{\{0 \le X_i \le \theta\}} \Rightarrow \hat{\theta} = \max_{1 \le i \le n} X_i.$$

In the case of the following contamination, the MLE is extremely far from the truth :

$$P_0 = (1 - \varepsilon).\mathcal{U}$$
nif $[0, 1] + \varepsilon.\mathcal{N}(10^{10}, 1)...$

Some problems with the likelihood Minimum Distance Estimation (MDE)

Minimum Distance Estimation

Empirical distribution :
$$\hat{P}_n := rac{1}{n} \sum_{i=1}^n \delta_{X_i}.$$

Minimum Distance Estimation (MDE)

Let $d(\cdot, \cdot)$ be a metric on probability distributions.

$$\hat{\theta}_d := \operatorname*{arg\,min}_{\theta \in \Theta} d\left(P_{\theta}, \hat{P}_n\right).$$

Wolfowitz, J. (1957). The minimum distance method. The Annals of Mathematical Statistics.

Idea : MDE with an adequate d leads to robust estimation.

Bickel, P. J. (1976). Another look at robustness : a review of reviews and some new developments. Scandinavian Journal of Statistics. Discussion by Sture Holm.

Parr, W. C. & Schucany, W. R. (1980). Minimum distance and robust estimation. JASA.

Some problems with the likelihood Minimum Distance Estimation (MDE)

Integral Probability Semimetrics

Integral Probability Semimetrics (IPS)

Let ${\mathcal F}$ be a set of real-valued, measurable functions and put

$$d_{\mathcal{F}}(P,Q) = \sup_{f \in \mathcal{F}} \left| \mathbb{E}_{X \sim P}[f(X)] - \mathbb{E}_{X \sim Q}[f(X)] \right|$$

Müller, A. (1997). Integral probability metrics and their generating classes of functions. Applied Probability.

- assumptions required in order to ensure that $d_{\mathcal{F}}(P, Q) = 0 \Rightarrow P = Q$ (that is, $d_{\mathcal{F}}$ is a metric).
- assumptions required in order to ensure that $d_{\mathcal{F}} < +\infty$.

Some problems with the likelihood Minimum Distance Estimation (MDE)

Non-asymptotic bound for MDE

Theorem 1

- X_1, \ldots, X_n i.i.d from P_0 ,
- for any $f \in \mathcal{F}$, $\sup_{x \in \mathcal{X}} |f(x)| \leq 1$.

Then

$$\mathbb{E}\left[d_{\mathcal{F}}(P_{\hat{\theta}_{d_{\mathcal{F}}}}, P_0)\right] \leq \inf_{\theta \in \Theta} d_{\mathcal{F}}(P_{\theta}, P_0) + 4.\operatorname{Rad}_n(\mathcal{F})$$

Rademacher complexity

$$\operatorname{Rad}_{n}(\mathcal{F}) := \sup_{P} \mathbb{E}_{Y_{1},...,Y_{n} \sim P} \mathbb{E}_{\epsilon_{1},...,\epsilon_{n}} \left[\sup_{f \in \mathcal{F}} \frac{1}{n} \sum_{i=1}^{n} \epsilon_{i} f(Y_{i}) \right].$$

where $\epsilon_1, \ldots, \epsilon_n$ are i.i.d Rademacher variables :

$$\mathbb{P}(\epsilon_1=1)=\mathbb{P}(\epsilon_1=-1)=1/2.$$

Minimum Distance Estimation (MDE)

Example 1 : set of indicators

$$\mathbb{1}_{\mathcal{A}}(x) = \begin{cases} 1 \text{ if } x \in \mathcal{A}, \\ 0 \text{ if } x \notin \mathcal{A}. \end{cases} \xrightarrow{+ / -} \xrightarrow{+ + / -} \xrightarrow{- - + + / -} \xrightarrow{+ + / -} \xrightarrow{+ - -} \xrightarrow{+ - + / -} \xrightarrow{+ - - - -} \xrightarrow{+ - - -} \xrightarrow{+ - - -} \xrightarrow{+ - - -} \xrightarrow{+ - - - -} \xrightarrow{+ - - - -$$

Reminder - Vapnik-Chervonenkis dimension

Assume that
$$\mathcal{F} = \{\mathbb{1}_A, A \in \mathcal{A}\}$$
 for some $\mathcal{A} \subseteq \mathcal{P}(\mathcal{X})$,
• $S_{\mathcal{F}}(x_1, \dots, x_n) := \{(f(x_1), \dots, f(x_n)), f \in \mathcal{F}\},$
• $\operatorname{VC}(\mathcal{F}) := \max\{n : \exists x_1, \dots, x_n, |S_{\mathcal{F}}(x_1, \dots, x_n)| = 2^n\}$

Theorem (Bartlett and Mendelson)

$$\operatorname{Rad}_n(\mathcal{F}) \leq \sqrt{\frac{2.\operatorname{VC}(\mathcal{F})\log(n+1)}{n}}$$

1

Bartlett, P. L. & Mendelson, S. (2002). Rademacher and Gaussian complexities : Risk bounds and structural results. JMLR.

> Pierre Alguier, RIKEN AIP Minimum MMD estimation

Example 1 : KS and TV distances

Two classical examples :

- $\mathcal{A} = \{ \text{all measurable sets in } \mathcal{X} \}$, then $d_{\mathcal{F}}(\cdot, \cdot)$ is the total variation distance $TV(\cdot, \cdot)$.
 - $\operatorname{VC}(\mathcal{F}) = +\infty$ when $|\mathcal{X}| = +\infty$,
 - in general, $\operatorname{Rad}_n(\mathcal{F}) \nrightarrow 0$.
- $\mathcal{X} = \mathbb{R}$, $\mathcal{A} = \{(-\infty, x], x \in \mathbb{R}\}$, then $d_{\mathcal{F}}(\cdot, \cdot)$ is the Kolmogorov-Smirnov distance $\mathrm{KS}(\cdot, \cdot)$.
 - KS distance was actually proposed by S. Holm for robust estimation,
 - $\operatorname{VC}(\mathcal{F}) = 1$, so :

$$\mathbb{E}\left[\mathrm{KS}(P_{\hat{\theta}_{\mathrm{KS}}}, P_0)\right] \leq \inf_{\theta \in \Theta} \mathrm{KS}(P_{\theta}, P_0) + 4.\sqrt{\frac{2\log(n+1)}{n}}.$$

Example 2 : Maximum Mean Discrepancy (MMD)

- RKHS $(\mathcal{H}, \langle \cdot, \cdot \rangle_{\mathcal{H}})$ with kernel $k(x, y) = \langle \phi(x), \phi(y) \rangle_{\mathcal{H}}$.
- If $\|\phi(x)\|_{\mathcal{H}} = k(x,x) \leq 1$ then $\mathbb{E}_{X \sim \mu}[\phi(X)]$ is well-defined .
- The map $\mu \mapsto \mathbb{E}_{X \sim \mu}[\phi(X)]$ is one-to-one if k is characteristic.
- Gaussian kernel $k(x, y) = \exp(-||x y||^2/\gamma^2)$ satisfies these assumption.

$$\mathcal{F} = \{f \in \mathcal{H} : \|f\|_{\mathcal{H}} \leq 1\}.$$

$$\mathbb{D}_{k}(P,Q) := d_{\mathcal{F}}(P,Q) = \sup_{f \in \mathcal{F}} \left| \mathbb{E}_{X \sim P}[f(X)] - \mathbb{E}_{X \sim Q}[f(X)] \right|$$
$$= \left\| \mathbb{E}_{X \sim P}[\phi(X)] - \mathbb{E}_{X \sim Q}[\phi(X)] \right\|_{\mathcal{H}}.$$

Some problems with the likelihood Minimum Distance Estimation (MDE)

Example 2 : MMD

Theorem (Bartlett and Mendelson)

$$\mathcal{F} = \{f \in \mathcal{H} : \|f\|_{\mathcal{H}} \leq 1\} \Rightarrow \operatorname{Rad}_n(\mathcal{F}) \leq \sqrt{\frac{\sup_x k(x,x)}{n}}.$$

Corollary

$$\mathbb{E}\left[\mathbb{D}_{k}(P_{\hat{\theta}_{\mathbb{D}_{k}}},P_{0})\right] \leq \inf_{\theta \in \Theta} \mathbb{D}_{k}(P_{\theta},P_{0}) + 4\sqrt{\frac{\sup_{x} k(x,x)}{n}}.$$

Some problems with the likelihood Minimum Distance Estimation (MDE)

Example 2 : MMD

We actually have

$$\begin{split} \mathbb{D}_k^2(P_\theta, \hat{P}_n) &= \mathbb{E}_{X, X' \sim P_\theta}[k(X, X')] - \frac{2}{n} \sum_{i=1}^n \mathbb{E}_{X \sim P_\theta}[k(X_i, X)] \\ &+ \frac{1}{n^2} \sum_{1 \leq i, j \leq n} k(X_i, X_j) \end{split}$$

$$\nabla_{\theta} \mathbb{D}_{k}^{2}(P_{\theta}, \hat{P}_{n})$$

$$= 2\mathbb{E}_{X, X' \sim P_{\theta}} \left\{ \left[k(X, X') - \frac{1}{n} \sum_{i=1}^{n} k(X_{i}, X) \right] \nabla_{\theta} [\log p_{\theta}(X)] \right\}$$

that can be approximated by sampling from P_{θ} .

Example 3 : Wasserstein

Another classical metric belongs to the IPS family :

.

$$W_{\delta}(P,Q) = \sup_{f : \mathcal{X} \to \mathbb{R} \atop \text{Lip}(f) \leq 1} \left| \mathbb{E}_{X \sim P}[f(X)] - \mathbb{E}_{X \sim Q}[f(X)] \right|$$

where
$$\operatorname{Lip}(f) := \sup_{x \neq y} |f(x) - f(y)| / \delta(x, y).$$

Bound on the Rademacher complexity when \mathcal{X} is bounded :

Sriperumbudur, B.K., Fukumizu, K., Gretton, A., Schölkopf, B., Lanckriet, G.R. (2010). Non-parametric estimation of integral probability metrics. IEEE International Symposium on Information Theory.

Minimum Wasserstein estimation studied in :

Bernton, E., Jacob, P. E., Gerber, M. & Robert, C. P. (2019). On parameter estimation with the Wasserstein distance. Information and Inference : A Journal of the IMA.

Some problems with the likelihood Minimum Distance Estimation (MDE)

MDE and robustness

Reminder

$$\mathbb{E}\left[d_{\mathcal{F}}(P_{\hat{\theta}_{d_{\mathcal{F}}}},P_0)\right] \leq \inf_{\theta \in \Theta} d_{\mathcal{F}}(P_{\theta},P_0) + 4.\mathrm{Rad}_n(\mathcal{F}).$$

Huber's contamination model : $P_0 = (1 - \varepsilon)P_{\theta_0} + \varepsilon Q$.

$$d_{\mathcal{F}}(P_{\theta_{0}}, P_{0}) = \sup_{f \in \mathcal{F}} \left| \mathbb{E}_{X \sim P_{\theta_{0}}} f(X) - (1 - \varepsilon) \mathbb{E}_{X \sim P_{\theta_{0}}} f(X) - \varepsilon \mathbb{E}_{X \sim Q} f(X) \right|$$

=
$$\sup_{f \in \mathcal{F}} \left| \varepsilon \mathbb{E}_{X \sim P_{\theta_{0}}} f(X) - \varepsilon \mathbb{E}_{X \sim Q} f(X) \right|$$

=
$$\varepsilon . d_{\mathcal{F}}(P_{\theta_{0}}, Q) \leq 2\varepsilon \quad \text{if for any } f \in \mathcal{F}, \sup_{x} |f(x)| \leq 1$$

Corollary - in Huber's contamination model

$$\mathbb{E}\left[d_{\mathcal{F}}(P_{\hat{\theta}_{d_{\mathcal{F}}}}, P_{\theta_0})\right] \leq 4\varepsilon + 4.\mathrm{Rad}_n(\mathcal{F}).$$

MDE and robustness : toy experiment

Model : $\mathcal{N}(\theta, 1)$, X_1, \ldots, X_n i.i.d $\mathcal{N}(\theta_0, 1)$, n = 100 and we repeat the exp. 200 times. Kernel $k(x, y) = \exp(-|x - y|)$.

	$\hat{\theta}_{MLE}$	$\hat{ heta}_{ ext{MMD}_k}$	$\hat{ heta}_{\mathrm{KS}}$
mean abs. error	0.081	0.094	0.088

Now, $\varepsilon = 2\%$ of the observations drawn from a Cauchy.

mean abs. error 0.276 0.095 0.088

Now, $\varepsilon = 1\%$ are replaced by 1,000.

mean abs. error 10.008 0.088 0.082

2 Minimum MMD estimation

- Refinement of the bounds
- Applications and extensions

Improving the constant

From now, we assume that $\sup_{x} k(x, x) \leq 1$. We know :

$$\mathbb{E}\left[\mathbb{D}_k(P_{\hat{\theta}_{\mathbb{D}_k}},P_0)\right] \leq \inf_{\theta \in \Theta} \mathbb{D}_k(P_\theta,P_0) + \frac{4}{\sqrt{n}}.$$

We will now prove a better result without using the Rademacher complexity :

Theorem

$$\mathbb{E}\left[\mathbb{D}_k(P_{\hat{\theta}_{\mathbb{D}_k}}, P_0)\right] \leq \inf_{\theta \in \Theta} \mathbb{D}_k(P_\theta, P_0) + \frac{2}{\sqrt{n}}.$$

Refinement of the bounds Applications and extensions

Proof of the theorem : preliminary lemma

Lemma

For any P_0 , when X_1, \ldots, X_n are i.i.d from P_0 ,

$$\mathbb{E}\left[\mathbb{D}_k\left(\hat{P}_n,P^0\right)\right]\leq \frac{1}{\sqrt{n}}.$$

$$\begin{split} \left\{ \mathbb{E} \left[\mathbb{D}_{k} \left(\hat{P}_{n}, P^{0} \right) \right] \right\}^{2} &\leq \mathbb{E} \left[\mathbb{D}_{k}^{2} \left(\hat{P}_{n}, P^{0} \right) \right] \\ &= \mathbb{E} \left[\left\| (1/n) \sum (\mu(\delta_{X_{i}}) - \mu(P_{0})) \right\|_{\mathcal{H}}^{2} \right] \\ &= (1/n) \mathbb{E} \left[\left\| \mu(\delta_{X_{1}}) - \mu(P_{0}) \right\|_{\mathcal{H}}^{2} \right] \\ &\leq 1/n. \end{split}$$

Refinement of the bounds Applications and extensions

Proof of the theorem

$$\begin{aligned} \forall \theta, \ \mathbb{D}_k \left(P_{\hat{\theta}}, P^0 \right) &\leq \mathbb{D}_k \left(P_{\hat{\theta}}, \hat{P}_n \right) + \mathbb{D}_k \left(\hat{P}_n, P^0 \right) \\ &\leq \mathbb{D}_k \left(P_{\theta}, \hat{P}_n \right) + \mathbb{D}_k \left(\hat{P}_n, P^0 \right) \\ &\leq \mathbb{D}_k \left(P_{\theta}, P^0 \right) + 2\mathbb{D}_k \left(\hat{P}_n, P^0 \right) \end{aligned}$$

$$\mathbb{E}\left[\mathbb{D}_{k}\left(P_{\hat{\theta}},P_{0}\right)\right] \leq \inf_{\theta\in\Theta}\mathbb{D}_{k}(P_{\theta},P_{0}) + \frac{2}{\sqrt{n}}.$$

Refinement of the bounds Applications and extensions

A bound in probability

Thanks to McDiarmid's inequality :

Theorem

For any P_0 , when X_1, \ldots, X_n are i.i.d from P_0 , with probability at least $1 - \delta$,

$$\mathbb{D}_k\left(P_{\hat{ heta}}, P^0
ight) \leq \inf_{ heta \in \Theta} \mathbb{D}_k\left(P_{ heta}, P^0
ight) + rac{2+2\sqrt{2\log\left(rac{1}{\delta}
ight)}}{\sqrt{n}}.$$

Joint work with Badr-Eddine Chérief-Abdellatif (CNRS).

Chérief-Abdellatif, B.-E. and Alquier, P. Finite Sample Properties of Parametric MMD Estimation : Robustness to Misspecification and Dependence. Bernoulli, 2022.

Refinement of the bounds Applications and extensions

Example : Gaussian mean estimation

Example : $P_{\theta} = \mathcal{N}(\theta, \sigma^2 I)$ for $\theta \in \mathbb{R}^d$. Using a Gaussian kernel $k(x, y) = \exp(-||x - y^2||/\gamma^2)$,

$$\mathbb{D}_{k}^{2}\left(P_{\theta}, P_{\theta'}\right) = 2\left(\frac{\gamma^{2}}{4\sigma^{2} + \gamma^{2}}\right)^{\frac{d}{2}} \left[1 - \exp\left(-\frac{\|\theta - \theta'\|^{2}}{4\sigma^{2} + \gamma^{2}}\right)\right].$$

Together with the previous result, this gives :

$$\begin{split} \|\hat{\theta}_n^{MMD} - \theta_0\|^2 \\ \leq -(4\sigma^2 + \gamma^2) \log\left[1 - 4\frac{(1 + \sqrt{2\log 1/\delta})^2}{n} \left(\frac{4\sigma^2 + \gamma^2}{\gamma^2}\right)^{\frac{d}{2}}\right]. \end{split}$$

$$\begin{split} \gamma &= 2d\sigma^2 \Rightarrow \\ \|\hat{\theta}_n^{MMD} - \theta_0\|^2 \leq d\sigma^2 \frac{8e(1 + \sqrt{2\log 1/\delta})^2}{n} (1 + o(1)). \end{split}$$

Refinement of the bounds Applications and extensions

Variance-aware bounds (1/2)

$$\begin{split} \left\{ \mathbb{E}\left[\mathbb{D}_{k}\left(\hat{P}_{n},P^{0}\right)\right]\right\}^{2} &\leq \mathbb{E}\left[\mathbb{D}_{k}^{2}\left(\hat{P}_{n},P^{0}\right)\right] \\ &= \mathbb{E}\left[\left\|\left(1/n\right)\sum\left(\mu(\delta_{X_{i}})-\mu(P_{0})\right)\right\|_{\mathcal{H}}^{2}\right] \\ &= (1/n)\underbrace{\mathbb{E}\left[\left\|\mu(\delta_{X_{1}})-\mu(P_{0})\right\|_{\mathcal{H}}^{2}\right]}_{=:v_{k}(P_{0})} \end{split}$$

Lemma - variance-aware version

$$\mathbb{E}\left[\mathbb{D}_{k}\left(\hat{P}_{n}, P^{0}\right)\right] \leq \sqrt{\frac{\nu_{k}(P_{0})}{n}} \leq \sqrt{\frac{1}{n}}.$$

Refinement of the bounds Applications and extensions

Variance-aware bounds (2/2)

Theorem – bound in expectation

$$\mathbb{E}\left[\mathbb{D}_{k}(P_{\hat{\theta}}, P_{0})\right] \leq \inf_{\theta \in \Theta} \mathbb{D}_{k}(P_{\theta}, P_{0}) + 2\sqrt{\frac{\boldsymbol{v}_{k}(P_{0})}{n}}$$

Theorem – bound in probability

With probability at least $1-\delta$,

$$\mathbb{D}_k\left(P_{\hat{\theta}}, P^0\right) \leq \inf_{\theta \in \Theta} \mathbb{D}_k\left(P_{\theta}, P^0\right) + 2\sqrt{\frac{\nu_k(P_0)2\log\frac{1}{\delta}}{n}} + \frac{8\log\frac{1}{\delta}}{3n}.$$

Joint work with Geoffrey Wolfer (RIKEN AIP).

Wolfer, G. and Alquier, P. Variance-Aware Estimation of Kernel Mean Embedding. Preprint arXiv :2210.06672.

Refinement of the bounds Applications and extensions

Upper-bounding the variance $v_k(P_0)$

In the case of the Gaussian kernel

$$k(x, y) = \exp(-\|x - y\|^2/\gamma^2)$$

we have

$$\mathbf{v}_{k}(\mathbf{P}_{0}) \leq 1 - \exp\left[-\frac{2\mathrm{Tr}(\mathbf{Var}_{\mathbf{P}_{0}}(\mathbf{X}))}{\gamma^{2}}\right] \leq \begin{cases} \frac{2\mathrm{Tr}(\mathbf{Var}_{\mathbf{P}_{0}}(\mathbf{X}))}{\gamma^{2}}\\ 1. \end{cases}$$

Example : Gaussian mean estimation (continued).

Using the variance aware bound

$$\gamma = \gamma_n o +\infty \Rightarrow \|\hat{ heta}_n^{MMD} - heta_0\|^2 \le d\sigma^2 rac{4\log 1/\delta}{n}(1+o(1)).$$

Empirical bound

In practice, we can estimate $v_k(P_0)$ by

$$\hat{\mathbf{v}}_{k} := rac{1}{n-1} \sum_{i=1}^{n} \left(k(X_{i}, X_{i}) - rac{1}{n} \sum_{j=1}^{n} k(X_{i}, X_{j})
ight).$$

We have $\mathbb{E}(\hat{\mathbf{v}}_k) = \mathbf{v}_k(P_0)$, and

Theorem – bound with empirical variance

Assume that $k(x, y) = \psi(x - y) \in [a, b]$. Then, with probability at least $1 - \delta$,

$$\mathbb{D}_k\left(P_{\hat{\theta}}, P^0\right) \leq \inf_{\theta \in \Theta} \mathbb{D}_k\left(P_{\theta}, P^0\right) + 2\sqrt{\frac{\hat{\mathbf{v}}_k 2\log\frac{1}{\delta}}{n}} + \frac{32\sqrt{b-a}\log\frac{1}{\delta}}{3n}.$$

GAN (2/2)

Results from Dziugaite et al. (2015).

Inference for Systems of SDEs (1/2)

This paper developped the asymptotic theory of MMD :

Briol, F. X., Barp, A., Duncan, A. B., & Girolami, M. (2019). Statistical Inference for Generative Models with Maximum Mean Discrepancy. Preprint arXiv :1906.05944.

They also applied the method to inference in SDEs :

$$\mathrm{d}X_t = b(X_t, \theta_1)\mathrm{d}t + \sigma(X_t, \theta_2)\mathrm{d}W_t$$

- easy to sample from the model with a given $\theta = (\theta_1, \theta_2)$,
- they propose a method to approximate the gradient of the MMD criterion.

Inference for Systems of SDEs (2/2)

Example in a (stochastic) Lotka-Volterra model.

Results from Briol et al. (2019) : compare MMD minimization to Wasserstein minimization.

Regression

- problem with regression : we want to specify and estimate a parametric model $P_{\theta(X)}$ for Y|X. MMD requires to specify a model for (X, Y).
- natural idea : estimate the distribution of X by $\frac{1}{n} \sum_{i=1}^{n} \delta_{X_i}$ and use the MMD procedure on $P_{\theta(X)}$.
- the previous theory shows directly that we estimate the distribution of (X, Y) consistently.
- it is far more difficult to prove that we estimate the distribution of *Y*|*X*.

Joint work with M. Gerber (Bristol).

Alquier, P. and Gerber, M. (2020). Universal Robust Regression via Maximum Mean Discrepancy. Preprint arXiv.

Copulas

- another semi-parametric model : copulas.
- asymptotic theory + R package.
